

Dell Connected Configuration Service

Perform real-time configuration updates directly inside our configuration center

Streamline System Configuration

Dell's Connected Configuration Service gives you complete control to configure your systems exactly the way you want. You will be able to put an instance of your system management software such as Microsoft Endpoint Manager (MEM) inside our facilities.

Via a secure VPN connection, you can get direct access to servers in our Configuration Centers where you can complete all of your configuration tasks.

Connected Configuration allows imaging, changing BIOS settings, partitioning hard drives, loading third party software and applications and installing the latest drivers and patches as set up in your own customized task sequence. You will also be able to complete configuration tasks such as joining the domain that traditionally only can be performed when the system is present in your own network.

Key Benefits

- Speed — one of the fastest ways to deploy systems customized to individual users
- Configuration management from one central location for all PCs
- Real-time change control
- Systems arrive fully configured including:
 - ✓ Imaging
 - ✓ Domain join
 - ✓ Active directory
 - ✓ BIOS
 - ✓ Hard drive encryption
